

● Clinical trial of human bone density enhancement

It was verified that, by ingesting 2g of DONAN daily, which is 784 mg calcium per day, the bone density and the blood bone Alkaline Phosphatase were increased significantly after 3 months.

Ingest DONAN powder 1g each in the morning and in the evening, total 2g a day.

BMD (Bone density) tests were made for measuring the second metacarpal bone in the CXD method both before the test and after 3 months. BAP tests were made in the EIA method both before the test and after 3 months.

The subjects: total 15 females at the age of 43 to 76 (average age 59).

The detail of the Subjects: 11 females (average age 69) are in a healthy group having the bone density level of more than 80% of average value of that for a healthy young adult.

1 female has the value between 80% and 70%. 3 females have less than 70% of the bone density level in an osteoporosis group (average age 72).

Medical institution for the trial: Tougen-do clinic, Toho University School of Medicine anatomy classroom.
